GREYDIENT

Newsletter N°1

About the project

The Greydient project is a European innovative training network dedicated to training a next generation of Early Stage Researchers (ESR) to the recently introduced grey-box modelling approaches. Grey-box models aim at effectively combining white-box models simulating the physics (e.g., Finite element) with machine learning black-box models based on data (e.g., Neural networks). These methods are particularly relevant for the ongoing transition of European personal mobility towards safe and reliable intelligent systems. The project will thus contribute to training the next generation of European experts in this field, as well as pushing the state-of-the-art in Grey-box modelling to streamline this transition. The project counts 9 academic and industrial beneficiaries and 7 partner companies from 6 different countries.

14 ESRs recruited - 1 on the way

The recruitment campaign of the project started in January 2021 and was a great success due to the about 300 applications that were received. The selection procedure ended in May, and we are now very happy to announce the first 14 ESRs have been recruited! They are a highly qualified, motivated and diverse group with representatives from 4 continents.

A second recruitment campaign is ongoing for the ESR 7 position. A candidate has already been selected, stay tuned for more details!

First network-wide event

The end of 2021 marked the launch of the first network-wide event of the project organised in Belgium at the campus de Nayer of KU Leuven. The ESRs and supervisors were gathered for three days of scientific and soft-skills training. The perfect occasion to get to know each
